Seven reasons for Sigma-7

The Sigma Series of Servo Drives has evolved into the Sigma-7 Servo Drives, which provides you with the ultimate experience in seven key areas and delivers the optimal solution that only Yaskawa can offer.

Comprehensive motor and amplifier power range

Wide power range

- Very compact motors from 50 W to 15 kW
- Linear motors with iron core or ironless and peak forces up to 7,560 N

(2)

Savings through performance

Lower production costs

- Speed loop bandwidth of 3.1 kHz
- Shorter settling time, reduced positioning time, higher throughput

No additional cooling necessary

• Ambient temperature -5 – 55 °C (max. 60 °C with derating)

Energy savings and higher productivity

- High peak torque, fast acceleration, no amplifier oversizing
- Lightweight mechanics

Higher performance

- Overload 350 % for 3 5 seconds
- High peak torque, fast acceleration

Safety features

Smooth integration of mandatory legal safety standards

- The STO function is implemented by default in all Sigma-7 series servo amplifiers
- Build safer machines Sigma-7 satisfies the requirements of SIL 3 and PLe
- The safety functions STO, SS1, SS2, SOS, SLS, SLA, SSR, SDI, SLP, SLI, SLT, SMT, SCA and SSM can be integrated by using the safety module

High efficiency

Very low heat generation

- Optimized magnetic circuit improves motor efficiency
- Improved motor efficiency reduces heat generation and allows for more compact machines

High accuracy

Next level 24-bit absolute encoder for maximum accuracy

• Resolution of 16 million pulses per revolution for extremely precise positioning

Impressive system performance

Very high precision teamed up with fast, smooth operation

- Ripple compensation for highest demands in smoothness and dynamics
- Even for machines for which speed loop gains cannot be set high

Outstanding reliability

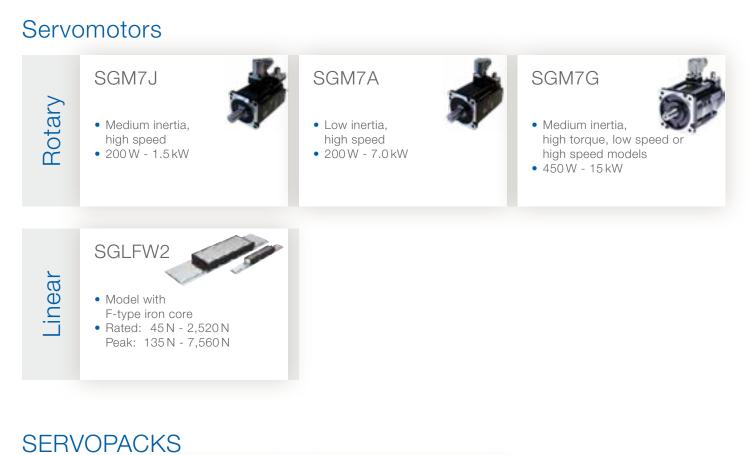

Even more reliability for your production

- More than 20 million servo systems in the field
- Improved machine reliability, reduced service and maintenance costs, less downtime

Applicable SERVOPACKs	SGD7S-	1R9D	3R5D	5R4D		

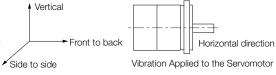

02D

*1. A Vibration class of V15 indicates a vibration amplitude of 15 µm maximum on the Servomotor without a load at the rated motor speed.

*2. The shock resistance for shock in the vertical direction when the Servomotor is mounted with the shaft in a horizontal position is given in the above table.

*3. The vertical, side-to-side, and front-to-back vibration resistance for vibration in three directions when the Servomotor is mounted with the shaft in a horizontal position is given in the above table. The strength of the vibration that the Servomotor can withstand depends on the application. Always check the vibration acceleration rate that is applied to the Servomotor with the actual equipment.

*4. If the surrounding air temperature will exceed 40°C, refer to the section "Applications where the Surrounding Air Temperature of the Servomotor Exceeds 40°C".

*5. If the altitude will exceed 1,000 m, refer to the section "Applications where the Altitude of the Servomotor Exceeds 1000m".

Inertia (Motor Moment of Inertia Ratio)	With External Regenerative Resistor or Dynamic Brake Resistor Connected		25 times		15 times	12 times		
Allowable Shaft	LF	mm	2	25	35			
Load *5	Allowable Radial Load	Ν	24	45	392	490		
	Allowable Thrust Load	Ν	7	4	147			

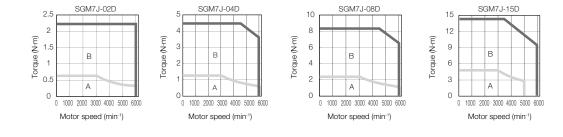

Note: The values in parentheses are for Servomotors with holding brakes.

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. The values for other items are at 20°C. These are typical values.
- 2. The rated torques are the continuous allowable torque values at a surrounding air temperature of 40°C with an aluminum heat sink of the dimensions given in the table.
- 3. This does not apply to the shaft opening. Protective structure specifications apply only when the special cable is used.
- 4. Observe the following precautions if you use a Servomotor with a holding brake.
 - The holding brake cannot be used to stop the Servomotor.
 - The time required to release the brake and the time required to brake depend on which discharge circuit is used. Confirm that the operation delay time is appropriate for the actual equipment.
 - The 24-VDC power supply is not provided by Yaskawa.
- 5. The allowable shaft loads are illustrated in the following figure. Design the mechanical system so that the thrust and radial loads applied to the Servomotor shaft end during operation do not exceed the values given in the table.

Motor speed-torque characteristics

A : Continuous duty zone

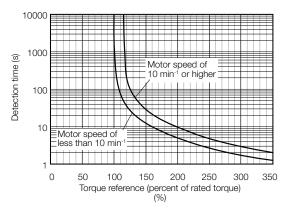

Notes:

- These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. These are typical values.
- The characteristics in the intermittent duty zone depend on the power supply voltage. The intermittent duty zones in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.
- If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torquemotor speed characteristics will become smaller because the voltage drop increases.

Servomotor overload protection characteristics

The overload detection level is set for hot start conditions with a Servomotor surrounding air temperature of 40°C.

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher.

Use the Servomotor so that the effective torque remains within the continuous duty zone given in Motor Speed-Torque Characteristics above.

Load moment of inertia

The load moment of inertia indicates the inertia of the load. The larger the load moment of inertia, the worse the response. If the moment of inertia is too large, operation will become unstable. The allowable size of the load moment of inertia (J_L) for the Servomotor is restricted. Refer to Ratings of Rotary Serovmotors SGM7J. This value is provided strictly as a guideline and results depend on Servomotor driving conditions.

An Overvoltage Alarm (A.400) is likely to occur during deceleration if the load moment of inertia exceeds the allowable load moment of inertia. SERVOPACKs with a built-in regenerative resistor may generate a Regenerative Overload Alarm (A.320). Perform one of the following steps if this occurs.

- Reduce the torque limit.
- Reduce the deceleration rate.
- Reduce the maximum motor speed.
- Install an external regenerative resistor if the alarm cannot be cleared using the above steps.

Servomotor heat dissipation conditions

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C when a heat sink is installed on the Servomotor. If the Servomotor is mounted on a small device component, the Servomotor temperature may rise considerably because the surface for heat dissipation becomes smaller. Refer to the following graphs for the relation between the heat sink size and derating rate.

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the Servomotor Overload Protection Characteristics.

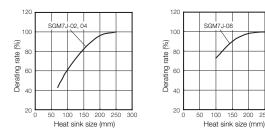

> 200 250

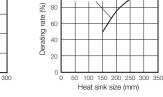

Note:

The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative

Important:

The actual temperature rise depends on how the heat sink (i.e., the Servomotor mounting section) is attached to the installation surface, what material is used for the Servomotor mounting section, and the motor speed. Always check the Servomotor temperature with the actual equipment.

SGM7.

120

10

See Servomotor Ratings for more information.

Applications where the surrounding air temperature of the servomotor exceeds 40°C

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C. If you use a Servomotor at a surrounding air temperature that exceeds 40°C (60°C max.), apply a suitable derating rate from the following graphs.

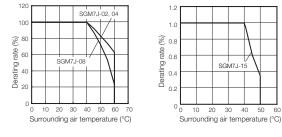

tion timing in advance based on the overload detection level of the motor. Refer to the Servomotor Overload Protection Characteristics.

Also, change the overload warning and overload alarm detec-

Note:

Note:

- Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.
- 2. The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative.

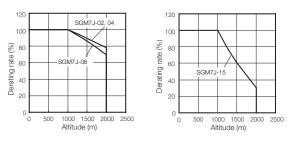

Applications where the altitude of the servomotor exceeds 1,000 m

The Servomotor ratings are the continuous allowable values at an altitude of 1,000 m or less. If you use a Servomotor at an altitude that exceeds 1,000 m (2,000 m max.), the heat dissipation effect of the air is reduced. Apply the appropriate derating rate from the following graphs. Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the Servomotor Overload Protection Characteristics.

 Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.

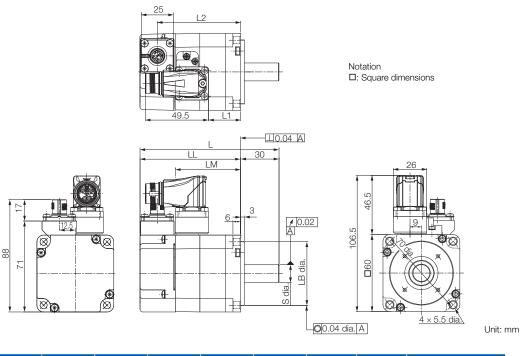

- 2. The derating rates are applicable only when the average motor speed is less than or equal to the rated motor
 - speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative.

*1 A Vibration class of V15 indicates a vibration amplitude of 15 µm maximum on the Servomotor without a load at the rated motor speed.

*2 The shock resistance for shock in the vertical direction when the Servomotor is mounted with the shaft in a horizontal position is given in the above table.

Shock Applied to the Servomotor

*3 The vertical, side-to-side, and front-to-back vibration resistance for vibration in three directions when the Servomotor is mounted with the shaft in a horizontal position is given in the above table. The strength of the vibration that the Servomotor can withstand depends on the application. Always check the vibration acceleration rate that is applied to the Servomotor with the actual equipment.

*4 Refer to the section "Applications where the Surrounding Air Temperature of the Servomotor Exceeds 40°C".

*5 If the altitude will exceed 1,000 m, refer to the section "Applications where the Altitude of the Servomotor Exceeds 1000m".

*6 If you use this combination, performance may not be as good, e.g., the control gain may not increase, in comparison with using a Sigma-7 Single Axis SERVOPACK.

Note: The values in parentheses are for Servomotors with Holding Brakes.

*1. For the SGM7A-02D to SGM7A-10D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. The values for other items are at 20°C. For the SGM7A-15D to SG-M7A-30D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.

*2. The rated torques are the continuous allowable torque values at a surrounding air temperature of 40°C with an alu-minum heat sink of the dimensions given in the table.

*3. This does not apply to the shaft opening. Protective structure specifications apply only when the special cable is used.

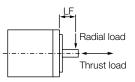

*4. Observe the following precautions if you use a Servomotor with a Holding Brake.

The holding brake cannot be used to stop the Servomotor.
The time required to release the brake and the time required to brake depend on which discharge circuit is used. Confirm that the operation delay time is appropriate for the actual equipment.

The 24-VDC power supply is not provided by Yaskawa.

- *5. The allowable shaft loads are illustrated in the following figure. Design the mechanical system so that the thrust and radial loads applied to the Servomotor shaft end during operation do not exceed the values given in the table.

*6. For the SGM7A-25D, the maximum motor speed for the continuous duty zone is 5,000 min-1. Use the Servomotor within the continuous duty zone for the average motor speed and effective torque

Torque (N·m)

Motor speed (min⁻¹)

Note:

1. For the SGM7A-02D to SGM7A-10D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C.

For the SGM7A-15D to SGM7A-30D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values. 2. The characteristics in the intermittent duty zone

- depend on the power supply voltage. The intermittent duty zones in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- 3. If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.
- 4. If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller because the voltage drop increases.

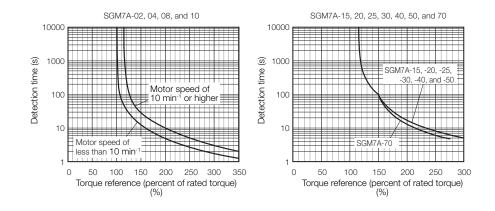

Motor speed (min⁻¹)

Rotary Motors

Appendix

Servomotor overload protection characteristics

The overload detection level is set for hot start conditions with a Servomotor surrounding air temperature of 40 °C.

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. Use the Servomotor so that the effective torque remains within the continuous duty zone given in Motor Speed-Torque Characteristics.

Load moment of inertia

The load moment of inertia indicates the inertia of the load. The larger the load moment of inertia, the worse the response. If the moment of inertia is too large, operation will become unstable.

The allowable size of the load moment of inertia (J_L) for the Servomotor is restricted. Refer to Ratings of Rotary Servomotors SGM7J. This value is provided strictly as a guideline and results depend on Servomotor driving conditions.

An Overvoltage Alarm (A.400) is likely to occur during deceleration if the load moment of inertia exceeds the allowable load moment of inertia. SERVOPACKs with a built-in regenerative resistor may generate a Regenerative Overload Alarm (A.320). Perform one of the following steps if this occurs.

- · Reduce the torque limit.
- Reduce the deceleration rate.
- Reduce the maximum motor speed.
- Install an external regenerative resistor if the alarm cannot be cleared using the above steps.

Servomotor heat dissipation conditions

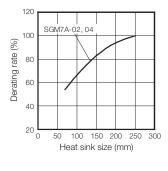

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C when a heat sink is installed on the Servomotor. If the Servomotor is mounted on a small device component, the Servomotor temperature may rise considerably because the surface for heat dissipation becomes smaller. Refer to the following graphs for the relation between the heat sink size and derating rate. Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

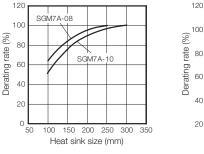

Note:

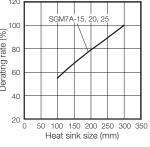

The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative.

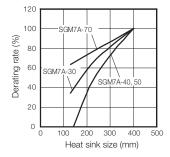

Important:

The actual temperature rise depends on how the heat sink (i.e., the Servomotor mounting section) is attached to the installation surface, what material is used for the Servomotor mounting section, and the motor speed. Always check the Servomotor temperature with the actual equipment.

See Servomotor Ratings for more information

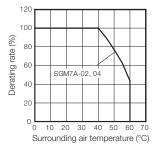

Applications where the surrounding air temperature of the servomotor exceeds 40°C

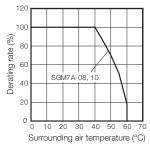

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C. If you use a Servomotor at a surrounding air temperature that exceeds 40°C (60°C max.), apply a suitable derating rate from the following graphs.

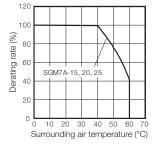

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

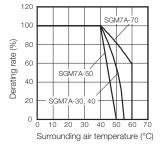

Note: 1. Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor. 2. The derating rates are applicable only when the average motor speed is less than or equal to the rated motor

speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative

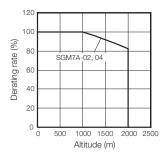

Applications where the altitude of the servomotor exceeds 1,000 m

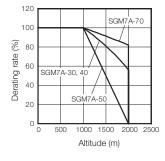

The Servomotor ratings are the continuous allowable values at an altitude of 1,000 m or less. If you use a Servomotor at an altitude that exceeds 1,000 m (2,000 m max.), the heat dissipation effect of the air is reduced. Apply the appropriate derating rate from the following graphs. Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

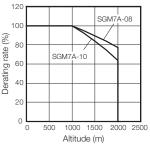

Note:

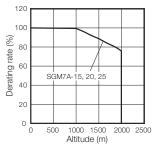

1. Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.

2. The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative.

SERVOPACKs	When	SGD7S-	3R5D	5R4D	8R4D	120D	170D	210D			_		
	using a High-speed Servomotor	SGD7W-	2R6D or 5R4D*6	5R4D				-	_				

*1. A vibration class of V15 indicates a vibration amplitude of 15 µm maximum on the Servomotor without a load at the rated motor speed.

*2. The shock resistance for shock in the vertical direction when the Servomotor is mounted with the shaft in a horizontal position is given in the above table.

*3. The vertical, side-to-side, and front-to-back vibration resistance for vibration in three directions when the Servomotor is mounted with the shaft in a horizontal position is given in the above table. The strength of the vibration that the Servomotor can withstand depends on the application. Always check the vibration acceleration rate that is applied to the Servomotor with the actual equipment.

*4. If the surrounding air temperature will exceed 40°C, refer to the section "Applications where the Surrounding Air Temperature of the Servomotor Exceeds 40°C".

*5. If the altitude will exceed 1,000 m, refer to the section "Applications where the Altitude of the Servomotor Exceeds 1000m".

*6. If you use this combination, performance may not be as good, e.g., the control gain may not increase, in comparison with using a Sigma-7S SERVOPACK.

Note:

The values in parentheses are for Servomotors with Holding Brakes.

- *1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- *2. The rated torques are the continuous allowable torque values at a surrounding air temperature of 40°C with an aluminum or steel heat sink of the dimensions given in the table.
- *3. This does not apply to the shaft opening. Protective structure specifications apply only when the special cable is used.
- *4. Observe the following precautions if you use a Servomotor with a Holding Brake.
- The holding brake cannot be used to stop the Servomotor.
- The time required to release the brake and the time required to brake depend on which discharge circuit is used. Confirm that the operation delay time is appropriate for the actual equipment.
- The 24-VDC power supply is not provided by Yaskawa.
- *5. The allowable shaft loads are illustrated in the following figure. Design the mechanical system so that the thrust and radial loads applied to the Servomotor shaft end during operation do not exceed the values given in the table.

Periphery

Motor speed-torque characteristics

Standard servomotors

A : Continuous duty zone

B: Intermittent duty zone

Motor speed (min-1)

Note:

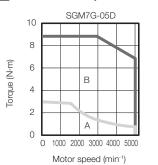

1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.

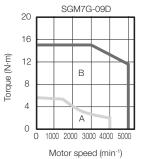

- 2. The characteristics in the intermittent duty zone depend on the power supply voltage. The intermittent duty zone in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- 3. If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.

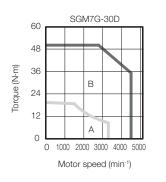

If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller 4. because the voltage drop increases

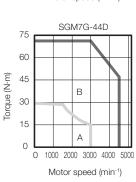

High-speed servomotors

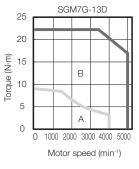

- A : Continuous duty zone
- B: Intermittent duty zone

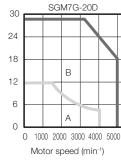

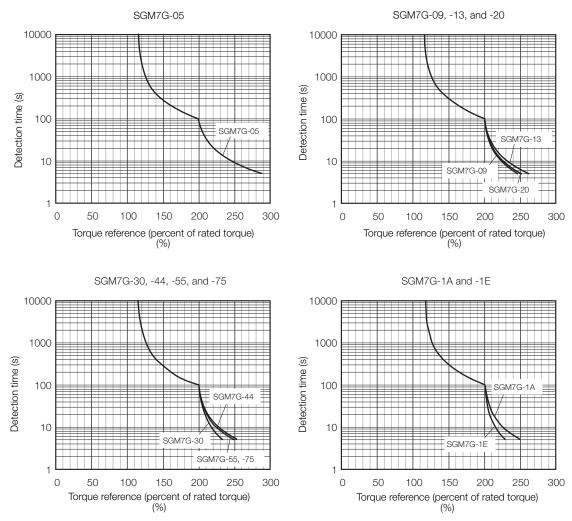

Torque (N·m)

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- 2. The characteristics in the intermittent duty zone depend on the power supply voltage. The intermittent duty zone in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- З. If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.
- If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller 4. because the voltage drop increases

Servomotor overload protection characteristics

The overload detection level is set for hot start conditions with a Servomotor surrounding air temperature of 40 °C.

Standard servomotors

Note:

The overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. Use the Servomotor so that the effective torque remains within the continuous duty zone given in Motor Speed-Torque Characteristics.

300

Load moment of inertia

The load moment of inertia indicates the inertia of the load. The larger the load moment of inertia, the worse the response. If the moment of inertia is too large, operation will become unstable.

The allowable size of the load moment of inertia (JL) for the Servomotor is restricted. Refer to Ratings of Rotary Serovmotors SGM7J. This value is provided strictly as a guideline and results depend on Servomotor driving conditions.

An Overvoltage Alarm (A.400) is likely to occur during deceleration if the load moment of inertia exceeds the allowable load moment of inertia. SERVOPACKs with a built-in regenerative resistor may generate a Regenerative Overload Alarm (A.320). Perform one of the following steps if this occurs.

- Reduce the torgue limit.
- · Reduce the deceleration rate.
- Reduce the maximum motor speed.
- Install an external regenerative resistor if the alarm cannot be cleared using the above steps.

Servomotor heat dissipation conditions

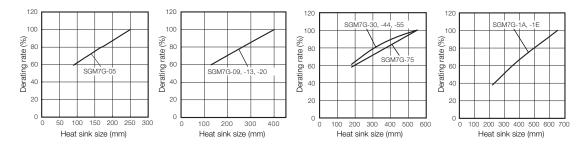

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C when a heat sink is installed on the Servomotor. If the Servomotor is mounted on a small device component, the Servomotor temperature may rise considerably because the surface for heat dissipation becomes smaller. Refer to the following graphs for the relation between the heat sink size and derating rate. Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

Note:

The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative.

Important:

The actual temperature rise depends on how the heat sink (i.e., the Servomotor mounting section) is attached to the installation surface, what material is used for the Servomotor mounting section, and the motor speed. Always check the Servomotor temperature with the actual equipment.

See Servomotor Ratings for more information.

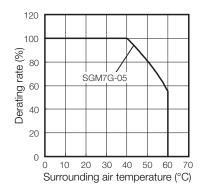

Applications where the surrounding air temperature of the servomotor exceeds 40°C

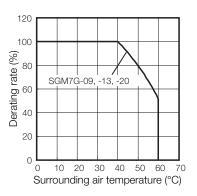

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C. If you use a Servomotor at a surrounding air temperature that exceeds 40°C (60°C max.), apply a suitable derating rate from the following graphs.

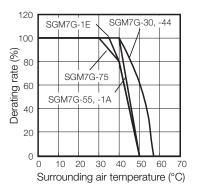

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

Note: 1. Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.

The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative

Applications where the altitude of the servomotor exceeds 1,000 m

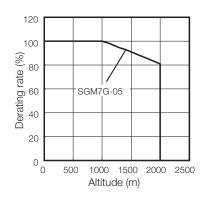

The Servomotor ratings are the continuous allowable values at an altitude of 1,000 m or less. If you use a Servomotor at an altitude that exceeds 1,000 m (2,000 m max.), the heat dissipation effect of the air is reduced. Apply the appropriate derating rate from the following graphs.

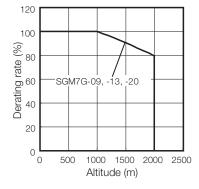

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

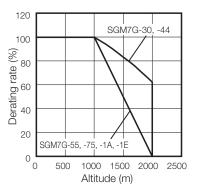

Note:

1. Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor

2. The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your Yaskawa representative

Note: This information is provided to explain model numbers. It is not meant to imply that models are available for all combinations of codes.

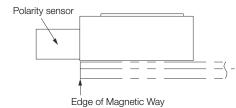

Precautions on moving coils with polarity sensors

Note: When you use a Moving Coil with a Polarity Sensor, the Magnetic Way must cover the bottom of the polarity sensor. Refer to the example that shows the correct installation. When determining the length of the Moving Coil's stroke or the length of the Magnetic Way, consider the total length (L) of the Moving Coil and the polarity sensor. Refer to the following table.

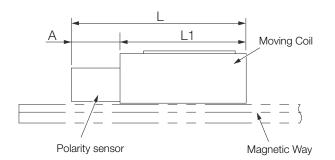

Correct installation

Incorrect installation

Total length of moving coil with polarity sensor

*1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. The values for other items are at 20°C. These are typical values.

*2. The rated forces are the continuous allowable force values at a ambient temperature of 40°C with an aluminum heat sink of the dimensions given in the following table. Heat Sink Dimensions:
150 mm × 100 mm × 10 mm: SGLFW2-30D070A
254 mm × 254 mm × 25 mm: SGLFW2-30D120A and -30D230A
400 mm × 500 mm × 40 mm: SGLFW2-45D200A and -45D380A

Force-motor speed characteristics

Notes:

1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. These are typical values.

2. The characteristics in the intermittent duty zone depend on the power supply voltage.

3. If the effective force is within the allowable range for the rated force, the Servomotor can be used within the intermittent duty zone.

4. If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller because the voltage drop increases.

Force-motor speed characteristics

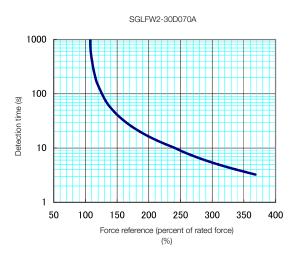

Notes:

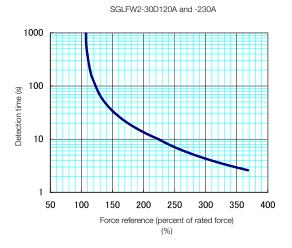

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. These are typical values.
- 2. The characteristics in the intermittent duty zone depend on the power supply voltage.
- 3. If the effective force is within the allowable range for the rated force, the Servomotor can be used within the intermittent duty zone.
- 4. If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller because the voltage drop increases.

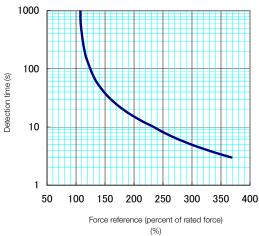

Servomotor overload protection characteristics

The overload detection level is set for hot start conditions with a Servomotor ambient air temperature of 40°C.

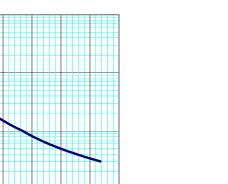

SGLFW2-45D, -90D, and -1DD

Notes:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. Use the Servomotor so that the effective force remains within the continuous duty zone given in Force-Motor Speed Characteristics.

SERVOPACK overload protection characteristics

The overload detection level is set for hot start conditions with a SERVOPACK surrounding air temperature of $55^{\circ}C^{*}$.

An overload alarm (A.710 or A.720) will occur if overload operation that exceeds the overload protection characteristics shown in the following diagram (i.e., operation on the right side of the applicable line) is performed.

The actual overload detection level will be the detection level of the connected SERVOPACK or Servomotor that has the lower overload protection characteristics. In most cases, that will be the overload protection characteristics of the Servomotor.

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher.

For a Yaskawa-specified combination of SERVOPACK and Servomotor, maintain the effective torque within the continuous duty zone of the

torque-motor speed characteristic of the Servomotor.

* However, the range for the SGD7S-370D is -5°C to 40°C.

Protective Functions		Overcurrent, overvoltage, low voltage, overload, regeneration error, etc.			
Utility Functions		Gain adjustment, alarm history, jogging, origin search, etc.			
	Inputs	/HWBB1 and /HWBB2: Base block signals for Power Modules			
Safety Functions	Output	EDM1: Monitors the status of built-in safety circuit (fixed output).			
	Applicable Standards*3	ISO13849-1 PLe (Category 3), IEC61508 SIL3			
Applicable Option Mo	dules	Fully-closed Modules, Option Module Safety			

*1. If you combine a Sigma-7 SERVOPACK with a Sigma-V Option Module, the surrounding air temperature specification of the Sigma-V SERVOPACKs must be used, i.e., 0 °C to 55 °C. Also, the applicable surrounding range cannot be increased by derating.

*2. The coefficient of speed fluctuation for load fluctuation is defined as follows:

Coeficient of speed fluctuation = No-load motor speed - Total-load motor speed × 100% Rated motor speed

*3. The SGD7S-210D, -260D, -280D, and -370D do not have a dynamic brake (DB). If a dynamic brake is necessary, create an external dynamic brake circuit.

*4. Always perform risk assessment for the system and confirm that the safety requirements are met.

Item		Specification
	Communications Protocol	MECHATROLINK-III
MECHATROLINK-III	Station Address Settings	03 to EF hex (maximum number of slaves: 62) The rotary switches (S1 and S2) are used to set the station address.
Communications	Transmission Speed	100 Mbps
	Transmission Cycle	125 µs, 250 µs, 500 µs, 750 µs, 1.0 ms to 4.0 ms (multiples of 0.5 ms) 32 or 48 bytes/station
	Number of Transmission Bytes	A DIP switch (S3) is used to select the number of transmission bytes.
	Performance	Position, speed, or torque control with MECHATROLINK-III communications
Reference Method	Reference Input	MECHATROLINK-III commands (sequence, motion, data setting, data access, monitoring, adjustment, etc.)
	Profile	MEACHATROLINK-III standard servo profile
MECHATROLINK-III C	ommunications Setting Switches	Rotary switch (S1 and S2) positions: 16 Number of DIP switch (S3) pins: 4 Number of points: 2 Output voltage range: ±10 VDC (effective linearity range: ±8 V)
Analog Monitor (CN5)		Resolution: 16 bits Accuracy: ±20 mV (Typ) Maximum output current: ±10 mA Settling time (±1%): 1.2 ms (Typ)
Dynamic Brake (DB)		Activated when a servo alarm or overtravel (OT) occurs, or when the power supply to the main circuit or servo is OFF.
Regenerative Processi	ng	Built-in Refer to the catalog for details.
Overtravel (OT) Preven	tion	Stopping with dynamic brake, deceleration to a stop, or coasting to a stop for the P-OT (Forward Drive Prohibit) or N-OT (Reverse Drive Prohibit) signal
Protective Functions		Overcurrent, overvoltage, low voltage, overload, regeneration error, etc.
Utility Functions		Gain adjustment, alarm history, jogging, origin search, etc.
	Inputs	/HWBB1 and /HWBB2: Base block signals for Power Modules
Safety Functions	Output	EDM1: Monitors the status of built-in safety circuit (fixed output).
	Applicable Standards*3	ISO13849-1 PLe (Category 3), IEC61508 SIL3
Applicable Option Mod	dules	Fully-closed Modules

*1. If you combine a Sigma-7 SERVOPACK with a Sigma-V Option Module, the surrounding air temperature specification of the Sigma-V SERVOPACKs must be used, i.e., 0 °C to 55 °C. Also, the applicable surrounding range cannot be increased by derating.

*2. The coefficient of speed fluctuation for load fluctuation is defined as follows: Coefficient of speed fluctuation = $\frac{\text{No-load motor speed}}{\text{Rated motor speed}} \times 100\%$

*3. The SGD7S-210D, -260D, -280D, and -370D do not have a dynamic brake (DB). If a dynamic brake is necessary, create an external dynamic brake circuit.

*4. Always perform risk assessment for the system and confirm that the safety requirements are met.

Specifications using PROFINET communication reference

Item			Specification
Control Method			IGBT-based PWM control, sine wave current drive
	With Rotary Servo	omotor	Serial encoder: 24 bits (incremental encoder/absolute encoder)
Feedback	With Linear Servo	motor	 Absolute linear encoder (The signal resolution depends on the absolute linear encoder.) Incremental linear encoder (The signal resolution depends on the incremental linear encoder or Serial Converter Unit.)
	Surrounding Air Temperature*1		-5°C to 55°C (60°C with derating) However, the range for the SGD7S-370D is -5°C to 40°C.
	Storage Temperat	ture	-20°C to 85°C
	Surrounding Air H		95 % relative humidity max. (with no freezing or condensation)
	Storage Humidity		95 % relative humidity max. (with no freezing or condensation)
	Vibration Resistar		4.9 m/s ²
Environmental	Shock Resistance		19.6 m/s ²
Conditions	Degree of Protect	ion	IP10
	Pollution Degree		 2 Must be no corrosive or flammable gases. Must be no exposure to water, oil, or chemicals. Must be no dust, salts, or iron dust.
	Altitude		1,000 m or less (above 1,000 m with derating)
	Others		Do not use the SERVOPACK in the following locations: Locations subject to static electricity
			noise, strong electromagnetic/magnetic fields, or radioactivity Refer to the section Compliance with UL Standards, EU Directives, and Other Safety Standards
Applicable Standard	ds		(in Combination with SERVOPACK).
Nounting			Base-mounted
	Speed Control Ra	ange	1:5,000 (At the rated torque, the lower limit of the speed control range must not cause the Servomotor to stop.)
			$\pm 0.01\%$ of rated speed max. (for a load fluctuation of 0 % to 100 %)
Performance	Coefficient of Speed Fluctuation*2		0% of rated speed max. (for a voltage fluctuation of ± 10 %)
enormance			±0.1% of rated speed max. (for a temperature fluctuation of 25°C ±25°C)
	Torque Control Precision (Repeatability)		±1%
	Soft Start Time Setting		0 s to 10 s (Can be set separately for acceleration and deceleration.)
	Encoder Divided Pulse Output		Phase A, phase B, phase C: Line-driver output Number of divided output pulses: Any setting is allowed

Cables are manufactured with an accuracy of one decimal place. Customized cable length possible (e.g. 07A5 for 7.5 m).

*1.

When using the safety function, connect this cable to the safety devices. Even when not using the safety function, use SERVOPACKs with the Safe Jumper Connector (model: JZSP-CVH05-E) connected.

*2. Use the connector kit when you make cables yourself.

*3. This cable is available in two variants. The order number for these cables differs at the marked \Box , an "R" at this place is used for Cables with RJ45 Connectors on both ends, while an "M" is used for Cables with RJ45 Connector on One End and IMI Connector on the other End. "M" Variant not available for PROFINET cables.

Motor connection shielding clamp

Shielding clamp mountable on Sigma-7 400 V SERVOPACKs up to 15 kW. Contact your Yaskawa representative for more information.

SERVOPACK overload protection characteristics

The overload detection level is set for hot start conditions with a SERVOPACK surrounding air temperature of 55°C. An overload alarm (A.710 or A.720) will occur if overload operation that exceeds the overload protection characteristics shown in the following diagram (i.e., operation on the right side of the applicable line) is performed. The actual overload detection level will be the detection level of the connected SERVOPACK or Servomotor that has the lower overload protection characteristics. In most cases, that will be the overload protection characteristics of the Servomotor.

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. For a Yaskawa-specified combination of SERVOPACK and Servomotor, maintain the effective torque within the continuous duty zone of the torque-motor speed characteristic of the Servomotor.

Specifications using EtherCAT communication reference

Item			Specification
Control Method			IGBT-based PWM control, sine wave current drive
	With Rotary Servomotor		Serial encoder: 24 bits (incremental encoder/absolute encoder)
Feedback	With Linear Servo	omotor	 Absolute linear encoder (The signal resolution depends on the absolute linear encoder. Incremental linear encoder (The signal resolution depends on the incremental linear encoder or Serial Converter Unit.)
	Surrounding Air T	emperature	-5°C to 55°C (60°C with derating)

Cables for SERVOPACKs

Important

1. Use the cable specified by Yaskawa for the computer cable. Operation may not be dependable with any other cable.

Notes:

Refer to the manual for the following information. Cable dimensional drawings and cable connection specifications. Order numbers and specifications of individual connectors for cables. Sigma-7-Series AC Servo Drive Peripheral Device Selection Manual.

Name		Length (L)	Order Number	Appearance
Analog Monitor Cable		1 m	JZSP-CA01-E	
Digital Operator (including 1 m cable)		1 m	JUSP-OP05A-1-E

Cables are manufactured with an accuracy of one decimal place. Customized cable length possible (e.g. 07A5 for 7.5 m).

*1. When using the safety function, connect this cable to the safety devices.

Even when not using the safety function, use SERVOPACKs with the Safe Jumper Connector (model: JZSP-CVH05-E) connected.

*2. Use the connector kit when you make cables yourself.
*3. This cable is available in two variants. The order number for these cables differs at the marked

, an "R" at this place is used for Cables with RJ45 Connectors on both ends, while an "M" is used for Cables with RJ45 Connector on One End and IMI Connector on the other End.

Motor connection shielding clamp

Shielding clamp mountable on Sigma-7 400 V SERVOPACKs up to 15 kW. Contact your Yaskawa representative for more information.

SERVOPACK Model	Order No.	Specification
Sigma-7 400V up to 3.0kW	KLBUE 4-13.5_SC	
Sigma-7 400 V from 5 kW up to 7.5 kW	KLBUE 10-20_SC

FSoE safety module with optional I/Os

When it comes to safety, compromises are not an option. That's why Yaskawa Sigma-7 servodrives easily integrate into FSoE safety concepts. Up to 16 available safety functions, 10 of them can work in parallel. This allows secure and easy control even for the most complex applications. Sigma-7 safety modules enable high performance safe motion for your application.

Seamless integration of safety

Sigma-7 safety modules integrate seamlessly into the SERVOPACK. Therefore, both safe and non-safe axes have the same dimensions resulting in easier planning and maximum flexibility.

Option Modules Advanced Safety

Option modules for advanced safety

The advanced safety modules for Sigma-7 series servo drives allow an expandability of the servo amplifier's functionality. It implements safety functions that conform to EN ISO 13849-1 up to SIL3/ PLe and are specified in the individual IEC 61800-5-2 standard. In combination with EtherCAT[®] Servopacks with function type FT91 these modules enable optimum safety in a machine according to industry needs.

Two different modules are available in order to cover safety related demands in the field.

Model designation	Description	
SGD7S-OSB01A	Advanced Safety Module FSoE	
SGD7S-OSB02A	Advanced Safety Module FSoE and I/O	

Characteristics at a glance

- 14 safety functions:
- STO, SS1-r, SS1-t, SS2-r, SS2-t, SOS, SLS, SSM, SDI, SLP, SSR, SLI, SCA, SLA • 10 safety functions can work
- TO safety functions can work in parallel
- FSoE certified

- 16 safety functions: STO, SS1-r, SS1-t, SS2-r, SS2-t, SOS, SLS, SSM, SDI, SLP, SSR, SLI, SCA, SLA, SLT, SMT
- 10 safety functions can work in parallel
- I/O Board
 - 6 I/O dual channel SIL3/Ple Cat3
 - 4 safe digital input/output channels
 - 1 safe digital input
 - 1 safe analog input channel (0-10 V) / safe digital input
 - 2 I/O single channel SIL2/PLd Cat3
 - 1 analog input channel (PT1000)
 - 1 analog input channel (4-20 mA)
- FSoE certified

If the position deviation exceeds the limit, the safety module will activate STO. 	J	J
Safe Standstill	v ss2-t	 Safe Stop 2, deceleration time controlled and position monitored The safety module will activate SOS: after the monitoring time has elapsed. If the position deviation exceeds the limit, the safety module will activate STO. 	J	J
Safe Standstill	Logition to the solution of th	Safe Operating Stop On safety function execution request, the safety module will switch to position monitoring. If the position deviation exceeds the limit, the safety module will activate STO.	J	J
Safe Motion	V Salt Speed Link	Safely Limited Speed On safety function execution request, the safety module starts to monitor the speed (first deceleration monitoring, then constant speed monitoring). If any speed limit is violated, the safety module will activate the selected stopping method, for example STO (default).	J	J
Safe Motion		Safely Limited Acceleration This function monitors the acceleration operati- on of the motor according to the safety request input state. If the specified acceleration speed is exceeded, the selected motor stopping method will be applied, for example STO (default).	J	J

Option Modules Advanced Safety

Туре	Short	Function	Applic Advanced Saf	
		Function	SGD7S-OSB01A	SGD7S-OSB02A
Safe Motion	V till Epsed Window SSR	Safe Speed Range This function adds minimum speed monitoring to the SLS function. In other words, the maximum speed must not exceed a certain value, and the minimum speed must not drop below a certain value. If either of these limits is violated, the selected motor stopping method will be applied, for example STO	J	J
Safe Motion	Safe Direction t	(default). Safe Direction This function prevents the motor from moving in an invalid direction, it can only move in one (defined) direction. If the specified direction is violated, the safety module will activate STO.	J	J
Safe Positioning	SLP	Safely Limited Position This function monitors the end positions of previously defined ranges. If the actual position exceeds the limits, the safety module will activate the selected stopping methos, for example STO (default).	J	J
Safe Positioning	SLI	Safely Limited Increment This function monitors the movements of the drive for compliance with a defined increment. The reference position is defined when monitoring is activated. If a limit value is violated, the safety module will activate STO.	J	J
Safe Motion	SLT	Safely Limited Torque This function monitors the torque and compares the limit. If the torque limit is violated, the safety module will activate the selected stopping method, for example STO (default).	-	J
Safe Monitoring	Set Surger Status Set Trajectaux Works	Safe Motor Temperature This function monitors the temperature and com- pares it to the limit values. If the temperature limit is violated, the safety module will deactivate (Low Output) the assigned safe output. Please note that this is a monitoring function that does not activate a stopping method after a limit violation.	-	J
Safe Motion	Sofe Output Status	Safe CAM This function provides a safe output signal to indicate whether the motor shaft position is within a specified range. If the actual position exceeds the limits, the safety module will activate the configured safe output signal. Please note that this function does not activate a stopping method after a limit violation.	J	J
Safe Monitoring	Sefe Output Status	Safe Speed Monitor This function provides a safe output signal to indicate whether or speed is below a specified limit. If the speed limit is violated during constant speed moni- toring, the safety module will activate the configured safe output signal. Please note that this is a monitoring function that does not activate a stopping method after a limit violation.	J	J

Additional accessories

Model designation	Description
JZSP-P7R2-8-E	Mounting rail for option modules for Sigma-7 400 V SERVOPACKs
JUSP-7CN21	Safety I/O connector (for SGD7S-OSB02A)
SGDV-OFA01	Feedback option module for Yaskawa encoder
SGDV-OFB04A	Feedback option module for resolver
JZSP-Z002	20-bit absolute encoder
JZSP-CVS06-02-E	USB connection cable (Programming PC - SERVOPACK)

Configuration Tool: Advanced Safety Module Parameter Editor

Available on the Yaskawa Europe website.

Option Module Safety

Sigma-5 option module safety

The Safety Module for Sigma-7 series servodrives allows an expandability of the servo amplifier's functionality. It implements safety functions that conform to EN ISO 13849-1 and are specified in the individual IEC 61800-5-2 standard. You can combine it with a Sigma-7 400 V SERVOPACK to design optimum safety in a machine system according to industry needs.

SERVOPACKs, Option Module Safety and Mounting Rail need to be ordered separately.

Model designation	Description
SGDV-OSA01A000FT900	Safety Module

Mounting rail for option modules

Mounting rail for option modules for Sigma-7 400 V SERVOPACKs. Contact your Yaskawa representative for more information.

Fully-closed module

The Feedback Modules for Sigma-7 series servodrives allow an expandability of the servo amplifier's functionality. With fully-closed control, an externally installed encoder is used to detect the position of the controlled machine and the machine's position information is fed back to the SERVOPACK. High-precision positioning is possible because the actual machine position is fed back directly. To perform fully-closed loop control, a Fully-Closed Module and SERVOPACK are required.

SERVOPACKs, Option Module Feedback and Mounting Rail need to be ordered separately.

Fully-closed module

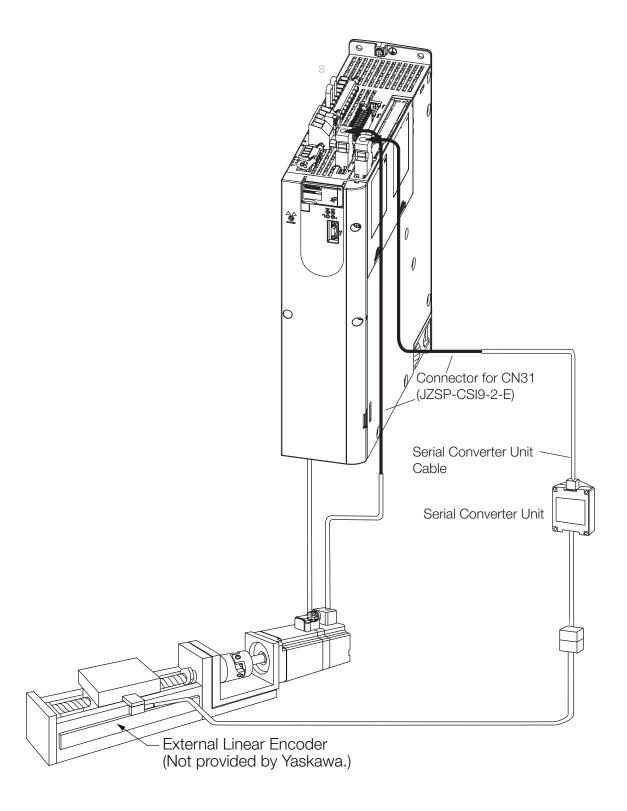

Model designation	Description
SGDV-OFA01A	Feedback Option Module for Yaskawa Serial Protocol
SGDV-OFB01A	Feedback Option Module for Serial and Sin/Cos Encoders
SGDV-OFB03A	Feedback Option Module for Pulse A quad B Encoders
SGDV-OFB04A	Feedback Option Module for Resolver

Mounting rail for option modules

Mounting rail for option modules for Sigma-7 400 V SERVOPACKs. Contact your Yaskawa representative for more information.

System configuration with SGDV-OFA01A

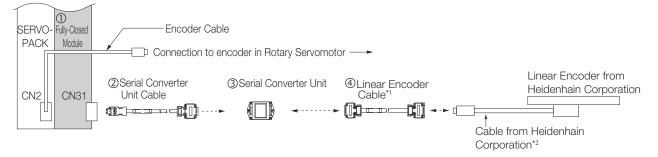

Rotary Motors

Connections to linear encoder from Heidenhain Corporation

Connections for a 1 Vp-p Analog Voltage Output Signal

You must make the connections through a Yaskawa Serial Converter Unit. The output signal will be multiplied by 8 bits (256 divisions) in the Serial Converter Unit.

*1. When using a JZDP-J00D-DDDSerial Converter Unit, do not use a Yaskawa Linear Encoder Cable that is longer than 3 m. *2. Contact Heidenhain Corporation for details on cables (analog 1 Vp-p output, D-sub 15-pin, male) from Heidenhain Corporation.

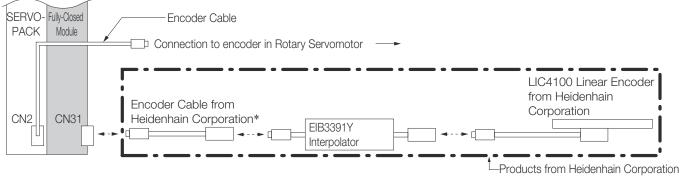

No.	Item	Model
0	Fully-Closed Module (Purchased alone)	Fully-Closed Module*1 SGDV-OFA01A
0	Serial Converter Unit Cable	JZSP-CLP70-DD*3-E
3	Serial Converter Unit ^{*2}	JZDP-H003-000
4	Linear Encoder Cable	JZSP-CLL30-□□ ⁺³ -E

*1 When ordering a SERVOPACK and a Fully-Closed Module separately, use this Fully-Closed Module model number. Please use the Yaskawa mounting rail JZSP-P7R2-8-E in combination with a Fully-Closed Module.
*2 Contact your Yaskawa representative for specific information.

*3 The boxes ($\Box\Box$) in the model number are reolaced with cable length when ordering. (1m = 01, 3m = 03, 5m = 05, 10m = 10, 15m = 15)

Connections when using a Yaskawa serial interface for the output signals

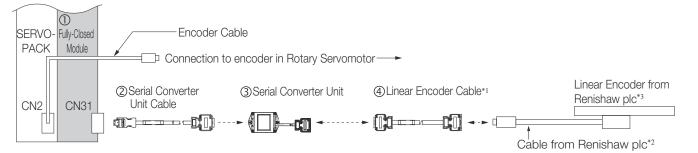

LIC4100 Linear Encoder with EIB3391Y Interpolator

* Use an Encoder Cable from Heidenhain Corporation. Contact Heidenhain Corporation for detailed Encoder Cable specifications.

Connections to linear encoder from Renishaw Plc

Connections for a 1 Vp-p Analog Voltage Output Signal

*1 When using a JZDP-J000-000 Serial Converter Unit, do not use a Yaskawa Linear Encoder Cable that is longer than 3 m.

*2 Contact Renishaw plc for details on cables (analog 1 Vp-p output, D-sub 15-pin, male) from Renishaw plc. *3 If you use the origin signals with a Linear Encoder from Renishaw plc, the origin may sometimes be falsely detected. If that occurs, use the BID/DIR signal

JZSP-CLL00-□□*3-E

*3 If you use the origin signals with a Linear Encoder from Renishaw plc, the origin may sometimes be falsely detected. If that occurs, use the BID/DIR signal to output the origin signal only in one direction.

Ν	о.	Item	Model
0		Fully-Closed Module (Purchased alone)	Fully-Closed Module*1 SGDV-OFA01A
0		Serial Converter Unit Cable	JZSP-CLP70-DD*3-E
3		Serial Converter Unit*2	JZDP-H005-000

*1 When ordering a SERVOPACK and a Fully-Closed Module separately, use this Fully-Closed Module model number. Please use the Yaskawa mounting rail JZSP-P7R2-8-E in combination with a Fully-Closed Module.

*2 Contact your Yaskawa representative for specific information.

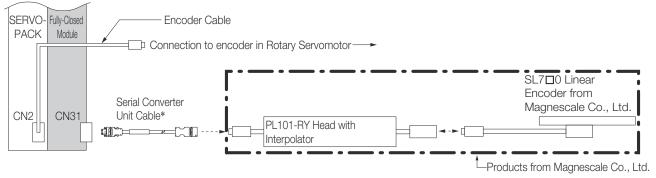

Linear Encoder Cable

4

*3 The boxes (\square) in the model number are reolaced with cable length when ordering. (1m = 01, 3m = 03, 5m = 05, 10m = 10, 15m = 15)

Connections to linear encoder from Magnescale Co., Ltd.

SL7D0 Linear Encoder and PL101-RY Sensor Head with Interpolator

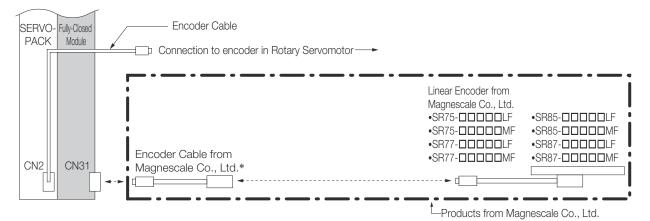

* Refer to the following section for information on cables to connect Fully-Closed Modules and Linear Encoders or chapter Serial Converter Unit Cables.

Appendix

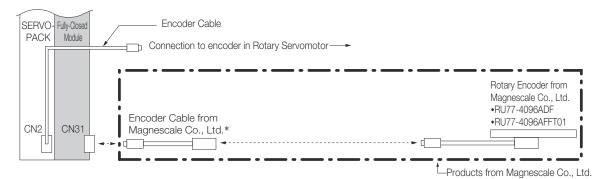

Periphery

SR-75, SR-77, SR-85, and SR-87 Linear Encoders

* To connect the SERVOPACK and Linear Encoder, use a CH33-xx CG Cable from Magnescale Co., Ltd. (This Cable has connectors designed for use with Yaskawa products).

RU77-4096ADF/RU77-4096AFFT01 Absolute Rotary Encoders

*To connect the SERVOPACK and Rotary Encoder, use a CE28-Series Extension Cable for RU77 from Magnescale Co., Ltd

Note: The RU77 is a single-turn absolute rotary encoder.

Connections to linear encoders from Mitutoyo Corporation **ST78 Linear Encoders**

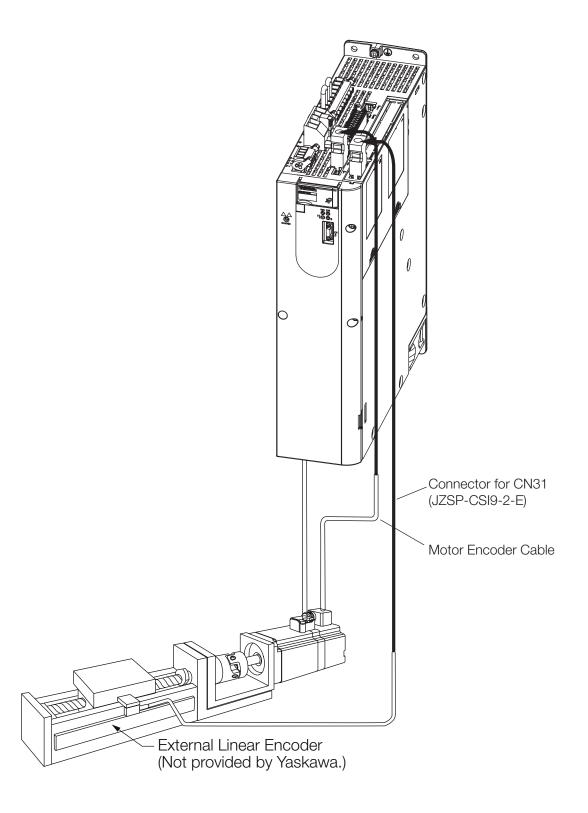

* Refer to the following section for information on cables to connect Fully-Closed Modules and Linear Encoders or chapter Serial Converter Unit Cables.

Option module feedback set-up for fully-closed loop control

The encoder parameters must be written into the module via the SERVOPACK using the SigmaWin+ engineering tool. Ask Yaskawa for preparation encoder parameter file for fully-closed loop.

Procedure to download the encoder parameter via SigmaWin+ version 7.2x via Sigma-7 400 V to option module feedback

- 1. Install a motor, encoder and SERVOPACK.
- 2. In SigmaWin+ select "Parameters > Parameter edit". Set parameter Pn002.3 = 1 or 3.
- 3. Start "Setup > Motor parameter scale write" in SigmaWin+.
- 4. Write configuration file to option module feedback.

Note: Refer to SigmaWin+ Operation manual for information on how to write parameters using SigmaWin+.

General specification SGDV-OFB01A

Item		Specification

Molded-case circuit bbreakers and fuses

Use a molded-case circuit breaker and fuse to protect the power supply line. They protect the power line by shutting OFF the circuit when overcurrent is detected. Select these devices based on the information in the following tables.

Notes:

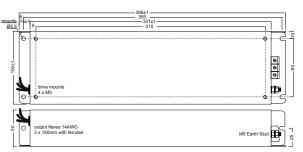

To comply with the Low Voltage Directive, always connect a fuse to the input side to protect against short-circuit accidents. Select fuses or molded-case circuit breakers that are compliant with UL standards. The following tables provide the net values of the current capacity and inrush current. Select a fuse and a molded-case circuit breaker that meet the following conditions.

Main circuit and a molded-case circuit breaker that meet the following conditions.
 Main circuit and control circuit: No breaking at three times the current value given in the table for 5 s.

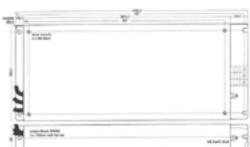

Inrush current: No breaking at the current value given in the table for 20 ms.

SERVOPACK main circuit wires

This section describes the main circuit wires for SERVOPACKs.

- These specifications are based on IEC/EN 61800-5-1, UL 61800-5-1, and CSA C22.2 No.14.
- 1. To comply with UL standards, use UL-compliant wires.
- 2. Use copper wires with a rated temperature of 75° or higher.
- 3. Use copper wires with a rated withstand voltage of 300 V or higher.

Note:

To use 600-V heat-resistant polyvinyl chloride-insulated wire (HIV), use the following table as reference for the applicable wires.
 The specified wire sizes are for three bundled leads when the rated current is applied with a surrounding air temperature of 40°C.

Select the wires according to the ambient temperature.

Periphery

Regenerative resistors

Types of regenerative resistors

The following regenerative resistors can be used:

• Built-in regenerative resistors: Some models of SERVOPACKs have regenerative resistors built into them.

• External regenerative resistors: These resistors are used when the internal capacitor and built-in regenerative resistor in the SERVOPACK cannot consume all of the regenerative power.

Use Yaskawa's SigmaSize+, an AC Servo drive capacity selection program, to determine if a regenerative resisitor is required.

Note: If you use an external regenerative resistor, you must change the setting parameter Pn600.

Built-in regenerative resistor

The following table gives the specifications of the built-in regenerative resistors in the SERVOPACKs and the amount of regenerative power (average values) that they can process. A built-in regenerative resistor is provided as a standard feature. Install an external regenerative resistor when the built-in regenerative resistor cannot process all the regenerative power.

SERVOPA	CK Model	Built-In Regenerative Resistor			
SGD7S-	SGD7W-	Resistance [Ω]	Capacity [W]	Minimum Allowable Resistance [Ω]	
1R9D, 3R5D	-	75	70	75

Note:

Contact your Yaskawa representative for information on Sigma-7 400V Dynamic Brake Resistors.

Calculate the energy that must be consumed by the resistance for one dynamic brake stop. To simplify the energy consumption calculation, assume that all the kinetic energy until the Servomotor stops is consumed by the dynamic brake resistor and use the following formula. Out of all possible operation patterns, use the one which maximizes the kinetic energy of the Servomotor.

Rotary Servomotors

Energy consumption of the dynamic brake resistor: $E_{_{DB}}$ [J] Motor moment of inertia*: $J_{_M}$ [kgm2] Load inertia: $J_{_L}$ [kgm2] Motor speed just before stopping with the dynamic brake: N [min-1] * For detailed information on the motor moment of inertia, refer to the catalog or Servomotor product manual.

Linear Servomotors

Energy consumption of the dynamic brake resistor: ${\sf E}_{_{\sf DB}}\,[J]$ Moving Coil mass*: ${\sf m}_{_{\sf M}}\,[{\sf kg}]$ Load mass: ${\sf m}_{_{\sf L}}\,[{\sf kg}]$ Motor speed just before stopping with the dynamic brake: v [m/s]

* For detailed information on Moving Coil mass, refer to the catalog or Servomotor product manual.

$$E_{fii} = \frac{1}{2} \times (J_M + J_i) \times \left(\frac{2\pi}{60} \times N\right)^2$$

$$E_{cos} = \frac{1}{2} \times (m_M + m_i) \times v^2$$

Batteries for servomotors with absolute encoders

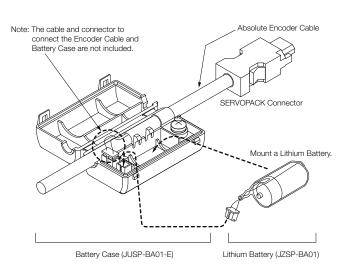

If you use an absolute encoder, you can use an Encoder Cable with a Battery Case connected to it to supply power and retain the absolute position data. You can also retain the absolute position data by supplying power from a battery on the host controller. The Battery Case is sold as a replacement part for the Battery Case that is included with an Absolute Encoder Cable.

Name	Order Number	Remarks
Battery case (case only)	JUSP-BA01-E	The Encoder Cable and Battery are not included. (This is a replacement part for a damaged Battery Case.)
Lithium Battery	JZSP-BA01	This is a special battery that mounts into the Battery Case.

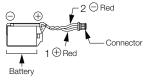

1. You cannot attach the Battery Case to an Incremental Encoder Cable.

2. Install the Battery Case where the ambient temperature is between -5°C and 60°C.

• Mounting a battery in the battery case

Obtain a Lithium Battery (JZSP-BA01) and mount it in the Battery Case.

ER3V (3.6 V, 1000 mAh) from Toshiba Battery Co., Ltd.

• Connecting a battery to the host controller

Use a battery that meets the specifications of the host controller. Use an ER6VC3N Battery (3.6 V, 2,000 mAh) from Toshiba Battery Co., Ltd. or an equivalent battery.

Software

SigmaSize+: AC servo capacity selection program

You can use the SigmaSize+ to select Servomotors and SERVOPACKs. There are two versions of the software: A Web-based version and a stand-alone version. The software supports all standard servo products sold by Yaskawa.

• Features

- Provides a vast amount of new product information.
- Lets you select servo products with a wizard.
- As long as you have a connection to the Internet, you can access and use the software anytime, anywhere. (Communications are encrypted for security)
- You can access and reuse previously entered data.

• Examples of the servo selection interface

Advanced safety module parameter editor

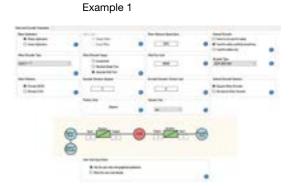

The advanced safety module parameter editor is required to set up and configure the advanced safety module.

• Features

With the TÜV certified Advanced Safety Module Parameter Editor you can configure the Advanced Safety Module. The PC configuration tool is used to create a safety project which contains the following safety settings:

- General Device Parameters
- Motor and Encoder Parameters
- User Unit and Encoder Parameters
- I/O Configuration
- Safety Functions

Selecting the servomotor capacity

Use Yaskawa's SigmaSize+, an AC servo drive capacity selection program, to select Servomotor capacity. With the SigmaSize+, you can find the optimum Servomotor capacity by simply selecting and entering information according to instructions from a wizard.

If you select a Servomotor capacity with a formula, refer to the following selecation examples.

Capacity Selection Example for a Rotary Servomotor: For Speed Control

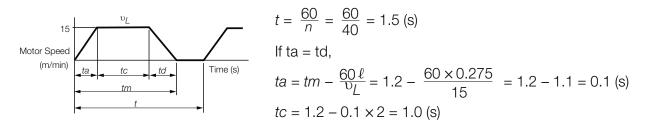

1. Mechanical Specifications

Item	Code	Value
Load Speed	v_L	15 m/min
Linear Motion Section Mass	т	250 kg
Ball Screw Length	ℓ_B	1.0 m
Ball Screw Diameter	d _B	0.02 m
Ball Screw Lead	P_B	0.01 m
Ball Screw Material Density	ρ	7.87 x 10 ³ kg/m ³
Gear Ratio	R	2 (gear ratio: 1/2)
External Force on Linear Motion Section	F	0 N

Item	Code	Value
Gear and Coupling Moment of Inertia	J_G	0.40 × 10 ⁻⁴ kg⋅m ²
Number of Feeding Operations	n	40 rotations/min
Feeding Distance	l	0.275 m
Feeding Time	tm	1.2 s max.
Friction Coefficient	μ	0.2
Mechanical Efficiency	η	0.9 (90%)

2. Speed Diagram

3. Motor Speed

L

Load shaft speed
$$n_L = \frac{v_L}{P_B} = \frac{15}{0.01} = 1,500 \text{ (min}^{-1}\text{)}$$

Motor shaft speed $n_M = n_L \cdot R = 1,500 \times 2 = 3,000 \text{ (min}^{-1}\text{)}$

4. Load Torque

$$T_L = \frac{(9.8 \cdot \mu \cdot m + F) \cdot P_B}{2\pi R \cdot \eta} = \frac{(9.8 \times 0.2 \times 250 + 0) \times 0.01}{2\pi \times 2 \times 0.9} = 0.43 \text{ (N-m)}$$

5. Load Moment of Inertia

Linear motion section

$$J_{L1} = m \left(\frac{P_B}{2\pi R}\right)^2 = 250 \times \left(\frac{0.01}{2\pi \times 2}\right)^2 = 1.58 \times 10^{-4} \text{ (kg·m}^2\text{)}$$

Ball screw

$$J_B = \frac{\pi}{32} \rho \cdot \ell_B \cdot d_B^4 \cdot \frac{1}{R^2} = \frac{\pi}{32} \times 7.87 \times 10^3 \times 1.0 \times (0.02)^4 \cdot \frac{1}{2^2} = 0.31 \times 10^{-4} \, (\text{kg·m}^2)$$

Coupling $J_G = 0.40 \times 10^{-4}$ (kg m²)

Load moment of inertia at motor shaft

$$J_L = J_{L1} + J_B + J_G = (1.58 + 0.31 + 0.40) \times 10^{-4} = 2.29 \times 10^{-4} (\text{kg} \cdot \text{m}^2)$$

6. Load Moving Power

$$P_O = \frac{2\pi n_M \cdot T_L}{60} = \frac{2\pi \times 3,000 \times 0.43}{60} = 135 \text{ (W)}$$

7. Load Acceleration Power

$$Pa = \left(\frac{2\pi}{60} n_{M}\right)^{2} \frac{J_{L}}{ta} = \left(\frac{2\pi}{60} \times 3,000\right)^{2} \times \frac{2.29 \times 10^{-4}}{0.1} = 226 \text{ (W)}$$

8. Servomotor Provisional Selection

① Selection Conditions

 $T_L \leq Motor rated torque$

$$\frac{(Po + Pa)}{2}$$
 < Provisionally selected Servomotor rated output < (Po + Pa)

 $n_M \leq$ Rated motor speed

 $J_L \leq$ Allowable load moment of inertia

The following Servomotor meets the selection conditions. SGM7J-02A Servomotor

2 Specifications of the Provisionally Selected Servomotor

Item	Value	
Rated Output	200 (W)	
Rated Motor Speed	3,000 (min ⁻¹)	
Rated Torque	0.637 (N·m)	
Instantaneous Maximum Torque	2.23 (N·m)	
Motor Moment of Inertia	0.263 × 10 ⁻⁴ (kg⋅m²)	
Allowable Load Moment of Inertia	$0.263 \times 10^{-4} \times 15 = 3.94 \times 10^{-4} (\text{kg} \cdot \text{m}^2)$	

9. Verification of the Provisionally Selected Servomotor

Verification of required acceleration torque:

$$T_P = \frac{2\pi n_M (J_M + J_L)}{60ta} + T_L = \frac{2\pi \times 3,000 \times (0.263 + 2.29) \times 10^{-4}}{60 \times 0.1} + 0.43$$

 \approx 1.23 (N·m) < Maximum instantaneous torque...Satisfactory Verification of required deceleration torque:

$$T_{S} = \frac{2\pi n_{M} (J_{M} + J_{L})}{60td} - T_{L} = \frac{2\pi \times 3,000 \times (0.263 + 2.29) \times 10^{-4}}{60 \times 0.1} - 0.43$$

≈ 0.37 (N·m) < Maximum instantaneous torque...Satisfactory

Capacity Selection for Servomotors

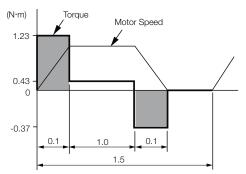

Verification of effective torque value:

$$Trms = \sqrt{\frac{T_P^2 \cdot ta + T_L^2 \cdot tc + Ts^2 \cdot td}{t}} = \sqrt{\frac{(1.23)^2 \times 0.1 + (0.43)^2 \times 1.0 + (0.37)^2 \times 0.1}{1.5}}$$

≈ 0.483 (N·m) < Rated torque...Satisfactory

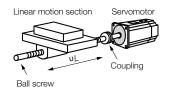

10.Result

It has been verified that the provisionally selected Servomotor is applicable. The torque diagram is shown below.

Capacity Selection Example for a Rotary Servomotor: For Position Control

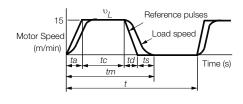

1. Mechanical Specifications

Item	Code	Value
Load Speed	v_L	15 m/min
Linear Motion Section Mass	т	80 kg
Ball Screw Length	ℓ_B	0.8 m
Ball Screw Diameter	d _B	0.016 m
Ball Screw Lead	P _B	0.005 m
Ball Screw Material Density	ρ	7.87 x 10 ³ kg/m ³
External Force on Linear Motion Section	F	0 N
Coupling Mass	m _C	0.3 kg

Item	Code	Value
Coupling Outer Diameter	d _C	0.03 m
Number of Feeding Operations	n	40 rotation/min
Feeding Distance	l	0.25 m
Feeding Time	tm	1.2 s max.
Electrical Stopping Precision	δ	±0.01 mm
Friction Coefficient	μ	0.2
Mechanical Efficiency	η	0.9 (90%)

2. Speed Diagram

$$t = \frac{60}{n} = \frac{60}{40} = 1.5 \text{ (s)}$$

If ta = td and ts = 0.1 (s),
$$ta = tm - ts - \frac{60\ell}{\nu_L} = 1.2 - 0.1 - \frac{60 \times 0.25}{15} = 0.1 \text{ (s)}$$
$$tc = 1.2 - 0.1 - 0.1 \times 2 = 0.9 \text{ (s)}$$

3. Motor Speed

Load shaft speed

$$n_L = \frac{v_L}{P_B} = \frac{15}{0.005} = 3,000 \text{ (min}^{-1}\text{)}$$

Motor shaft speed Direct

Direct coupling gear ratio
$$1/R = 1/1$$

Therefore, $n_M = n_L$ R = 3,000 × 1 = 3,000 (min⁻¹)

4. Load Torque

$$T_L = \frac{(9.8 \ \mu \cdot m + F) \cdot P_B}{2\pi R \cdot \eta} = \frac{(9.8 \times 0.2 \times 80 + 0) \times 0.005}{2\pi \times 1 \times 0.9} = 0.139 \text{ (N·m)}$$

5. Load Moment of Inertia

Linear motion section

$$J_{L1} = m \left(\frac{P_B}{2\pi R}\right)^2 = 80 \times \left(\frac{0.005}{2\pi \times 1}\right)^2 = 0.507 \times 10^{-4} \,(\text{kg} \cdot \text{m}^2)$$

Ball screw
$$J_B = \frac{\pi}{32} \rho \cdot \ell_B \cdot d_B^4 = \frac{\pi}{32} \times 7.87 \times 10^3 \times 0.8 \times (0.016)^4 = 0.405 \times 10^{-4} \text{ (kg·m}^2)$$

Coupling $J_C = \frac{1}{8} m_C \cdot d_C^2 = \frac{1}{8} \times 0.3 \times (0.03)^2 = 0.338 \times 10^{-4} \text{ (kg·m}^2)$

Load moment of inertia at motor shaft

$$J_L = J_{L1} + J_B + Jc = 1.25 \times 10^{-4} (\text{kg} \cdot \text{m}^2)$$

6. Load Moving Power

$$P_O = \frac{2\pi n_M \cdot T_L}{60} = \frac{2\pi \times 3,000 \times 0.139}{60} = 43.7 \text{ (W)}$$

7. Load Acceleration Power

$$Pa = \left(\frac{2\pi}{60} n_M\right)^2 \frac{J_L}{ta} = \left(\frac{2\pi}{60} \times 3,000\right)^2 \times \frac{1.25 \times 10^{-4}}{0.1} = 123.4 \text{ (W)}$$

8. Servomotor Provisional Selection

① Selection Conditions

 $T_{L} \leq Motor rated torque$

 $\frac{(Po + Pa)}{2} < Provisionally selected Servomotor rated output < (Po + Pa)$

 $n_M \leq$ Rated motor speed

 $J_L \leq$ Allowable load moment of inertia

The following Servomotor meets the selection conditions. SGM7J-01A Servomotor

© Specifications of the Provisionally Selected Servomotor

Item	Value
Rated Output	200 (W)
Rated Motor Speed	3,000 (min ⁻¹)
Rated Torque	0.318 (N·m)
Instantaneous Maximum Torque	1.11 (N·m)
Motor Moment of Inertia	0.0659 × 10 ⁻⁴ (kg·m ²)
Allowable Load Moment of Inertia	$0.0659 \times 10^{-4} \times 35 = 2.31 \times 10^{-4} \text{ (kg·m}^2\text{)}$
Encoder Resolution	24 bits (16,777,216 pulses/rev)

Capacity Selection for Servomotors

9. Verification of the Provisionally Selected Servomotor

Verification of required acceleration torque:

$$T_P = \frac{2\pi n_M (J_M + J_L)}{60ta} + T_L = \frac{2\pi \times 3,000 \times (0.0659 + 1.25) \times 10^{-4}}{60 \times 0.1} + 0.139$$

≈ 0.552 (N·m) < Maximum instantaneous torque...Satisfactory

Verification of required deceleration torque:

$$T_{\rm S} = \frac{2\pi n_M (J_M + J_L)}{60td} - T_L = \frac{2\pi \times 3,000 \times (0.0659 + 1.25) \times 10^{-4}}{60 \times 0.1} - 0.139$$

 \approx 0.274 (N·m) < Maximum instantaneous torque...Satisfactory

Verification of effective torque value:

$$Trms = \sqrt{\frac{T_P^2 \cdot ta + T_L^2 \cdot tc + Ts^2 \cdot td}{t}} = \sqrt{\frac{(0.552)^2 \times 0.1 + (0.139)^2 \times 0.9 + (0.274)^2 \times 0.1}{1.5}}$$

 \approx 0.192 (N·m) < Rated torque...Satisfactory

It has been verified that the provisionally selected Servomotor is applicable in terms of capacity. Position control is considered next.

10. Position Detection Resolution

Position detection unit: $\Delta^{\ell} = 0.01 \text{ mm/pulse}$ The number of pulses per motor rotation must be less than the encoder resolution (pulses/rev).

The number of pulses per revolution (pulses) = $\frac{P_B}{\Delta^{\ell}} = \frac{5 \text{ mm}}{0.01 \text{ mm}} = 500 < \text{Encoder resolution [16777216 (pulses/rev)]}$

11. Reference Pulse Frequency

 $vs = \frac{1,000 \,^{\circ}L}{60 \times \Delta_{\ell}} = \frac{1,000 \times 15}{60 \times 0.01} = 25,000 \text{ (pps)}$

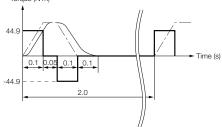

Confirm that the maximum input pulse frequency is greater than the reference pulse frequency. Refer to the specifications in the SERVOPACK manual for the maximum input pulse frequency.

It has been verified that the provisionally selected Servomotor is applicable for position control.

8. Result

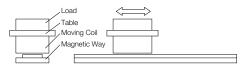

It has been verified that the provisionally selected Servomotor is applicable. The torque diagram is shown below.

Torque (N m)

Servomotor Capacity Selection Example for Linear Servomotors

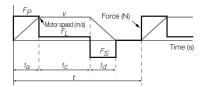

1. Mechanical Specifications

Item	Code	Value
Load Mass	m_W	1 kg
Table Mass	m_T	2 kg
Motor Speed	V	2 m/s
Feeding Distance	1	0.76 m
Friction Coefficient	μ	0.2

	Item	Code	Value
_	Acceleration Time	t _a	0.02 s
-	Constant-speed Time	t _c	0.36 s
-	Deceleration Time	t _d	0.02 s
-	Cycle Time	t	0.5 s
-	External Force on Linear Motion Section	F	0 N

- **3.** Steady-State Force (Excluding Servomotor Moving Coil) $F_L = \{9.8 \times \mu \times (m_W + m_T)\} + F = 9.8 \times 0.2 \times (1 + 2) + 0 = 5.88 \text{ (N)}$
- 4. Acceleration Force (Excluding Servomotor Moving Coil)

$$F_P = (m_W + m_T) \times \frac{v}{t_a} + F_L = (1 + 2) \times \frac{2}{0.02} + 5.88 = 305.88$$
 (N)

5. Provisional Selection of Linear Servomotor

① Selection Conditions

 $F_P \le$ Maximum force $\times 0.9$ $F_s \le$ Maximum force $\times 0.9$ $F_{rms} \le$ Rated force $\times 0.9$

Capacity Selection for Servomotors

2 Specifications of the Provisionally Selected Servomotor

Item	Value
Maximum Force	440 (N)
Rated Force	147 (N)
Moving Coil Mass (m _M)	0.82 (kg)
Servomotor Magnetic Attraction (F _{att})	0 (N)

6. Verification of the Provisionally Selected Servomotor Steady-State Force

 $F_L = \mu \{9.8 \times (m_W + m_T + m_M) + F_{att}\} = 0.2 \{9.8 \times (1 + 2 + 0.82) + 0\} = 7.5 (N)$ Verification of Acceleration Force

$$F_P = (m_W + m_T + m_M) \times \frac{v}{t_a} + F_L = (1 + 2 + 0.82) \times \frac{2}{0.02} + 7.5$$

= 389.5 (N) \leq Maximum force \times 0.9 (= 396 N)... Satisfactory

Verification of Deceleration Force

$$F_S = (m_W + m_T + m_M) \times \frac{v}{t_a} - F_L = (1 + 2 + 0.82) \times \frac{2}{0.02} - 7.5$$

= 374.5 (N) \leq Maximum force \times 0.9 (= 396 N)... Satisfactory Verification of Effective Force

$$F_{rms} = \sqrt{\frac{F_P^2 \cdot t_a + F_L^2 \cdot t_c + F_s^2 \cdot t_d}{t}} = \sqrt{\frac{389.5^2 \times 0.02 + 7.5^2 \times 0.36 + 374.5^2 \times 0.02}{0.5}}$$

= 108.3 (N) \leq Rated force x 0.9 (= 132.3 N)... Satisfactory

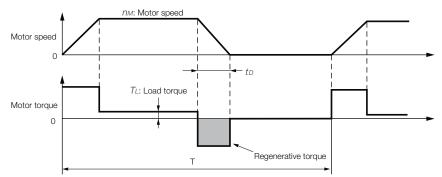

7. Result

It has been verified that the provisionally selected Servomotor is applicable.

Capacity Selection for Regenerative Resistors

Calculating the Regenerative Energy

This section shows how to calculate the regenerative resistor capacity for the acceleration/deceleration operation shown in the following figure.

Calculation Procedure for Regenerative Resistor Capacity

Step	Item	Code	Formula
1	Calculate the rotational energy of the Servo- motor.	E _S	$E_S = Jn_M^2 / 182$
2	Calculate the energy consumed by load loss during the deceleration period	EL	$E_L = (\pi/60) n_M T_L t_D$ Note: If the load loss is unknown, calculate the value with E_L set to 0.
3	Calculate the energy lost from Servomotor winding resistance.	E _M	(Value calculated from the graphs in \blacklozenge Servo- motor Winding Resistance Loss) × t_D
4	Calculate the energy that can be absorbed by the SERVOPACK.	E _C	Calculate from the graphs in ◆SERVOPACK- absorbable Energy
5	Calculate the energy consumed by the regenerative resistor.	E _K	$E_{K} = E_{S} - (E_{L} + E_{M} + E_{C})$ $E_{K} = E_{S} - (E_{L} + E_{M} + E_{C}) + E_{G}$ Note: Use this formula if there will be con- tinuous periods of regenerative oper- ation, such as for a vertical axis.
6	Calculate the required regenerative resistor capacity (W).	W _K	$W_{\mathcal{K}} = E_{\mathcal{K}}/(0.2 \times \mathrm{T})$

 E_G (joules): Energy for continuous period of regenerative operation

 $E_G = (2\pi/60) \, n_{MG} T_G t_G$

 $T_{\rm G}$: Servomotor's generated torque in continuous period of regenerative operation (N m)

 n_{MG} : Servomotor's motor speed for same operation period as above (min⁻¹)

 t_G : Same operation period as above (s)

Note: 1. The 0.2 in the equation for calculating W_K is the value when the regenerative resistor's utilized load ratio is 20%.

2. The units for the various symbols are given in the following table.

Code	Description	Code	Description
E_S to E_K	Energy in joules (J)	T_L	Load torque (N m)
W _K	Required regenerative resistor capacity (W)	t _D	Deceleration stopping time (s)
J	$= J_M + J_L (\mathrm{kg}\cdot\mathrm{m}^2)$	Т	Servomotor repeat operation cycle (s)
n _M	Servomotor motor speed (min ⁻¹)		·

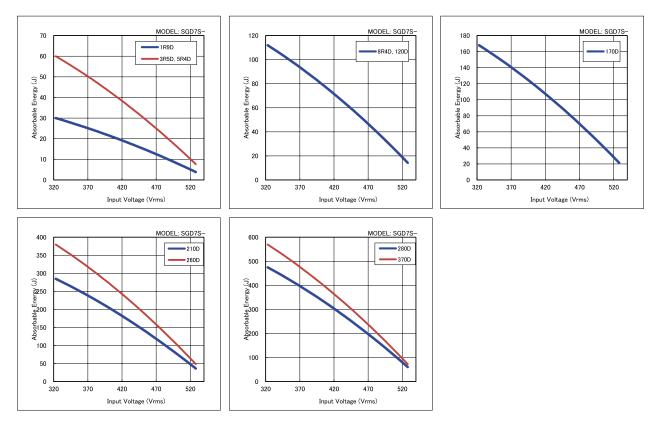

If the value of W_K does not exceed the capacity of the built-in regenerative resistor of the SERVO-PACK, an External Regenerative Resistor is not required. For details on the built-in regenerative resisters, refer to the SERVOPACK specifications. If the value of W_K exceeds the capacity of the built-in regenerative resistor, install an External Regenerative Resistor with a capacity equal to the value for W calculated above.

Details of warranty

Warranty period

The warranty period for a product that was purchased (hereinafter called the "delivered product") is one year from the time of delivery to the location specified by the customer or 18 months from the time of shipment from the Yaskawa factory, whichever is sooner.

Warranty scope

Yaskawa shall replace or repair a defective product free of charge if a defect attributable to Yaskawa occurs during the above warranty period. This warranty does not cover defects caused by the delivered product reaching the end of its service life and replacement of parts that require replacement or that have a limited service life.

This warranty does not cover failures that result from any of the following causes.

- Improper handling, abuse, or use in unsuitable conditions or in environments not described in product catalogs or manuals, or in any separately agreed-upon specifications
- Causes not attributable to the delivered product itself
- Modifications or repairs not performed by Yaskawa
- Use of the delivered product in a manner in which it was not originally intended
- · Causes that were not foreseeable with the scientific and technological understanding at the time of shipment from Yaskawa
- Events for which Yaskawa is not responsible, such as natural or human-made disasters

Limitations of liability

- Yaskawa shall in no event be responsible for any damage or loss of opportunity to the customer that arises due to failure of the delivered product.
- Yaskawa shall not be responsible for any programs (including parameter settings) or the results of program execution of the programs provided by the user or by a third party for use with programmable Yaskawa products.
- The information described in product catalogs or manuals is provided for the purpose of the customer purchasing the appropriate product for the intended application. The use thereof does not guarantee that there are no infringements of intellectual property rights or other proprietary rights of Yaskawa or third parties, nor does it construe a license.
- Yaskawa shall not be responsible for any damage arising from infringements of intellectual property rights or other proprietary rights of third parties as a result of using the information described in catalogs or manuals.

Suitability for use

- It is the customer's responsibility to confirm conformity with any standards, codes, or regulations that apply if the Yaskawa product is used in combination with any other products.
- The customer must confirm that the Yaskawa product is suitable for the systems, machines, and equipment used by the customer.
- Consult with Yaskawa to determine whether use in the following applications is acceptable. If use in the application is acceptable, use the product with extra allowance in ratings and specifications, and provide safety measures to minimize hazards in the event of failure.
 - » Outdoor use, use involving potential chemical contamination or electrical interference, or use in conditions or environments not described in product catalogs or manuals
 - » Nuclear energy control systems, combustion systems, railroad systems, aviation systems, vehicle systems, medical equipment, amusement machines, and installations subject to separate industry or government regulations
 - Systems, machines, and equipment that may present a risk to life or property
 - » Systems that require a high degree of reliability, such as systems that supply gas, water, or electricity, or systems that operate continuously 24 hours a day
 - » Other systems that require a similar high degree of safety
- Never use the product for an application involving serious risk to life or property without first ensuring that the system is designed to secure the required level of safety with risk warnings and redundancy, and that the Yaskawa product is properly rated and installed
- The circuit examples and other application examples described in product catalogs and manuals are for reference. Check the functionality and safety of the actual devices and equipment to be used before using the product
- Read and understand all use prohibitions and precautions, and operate the Yaskawa product correctly to prevent accidental harm to third parties

Specifications change

The names, specifications, appearance, and accessories of products in product catalogs and manuals may be changed at any time based on improvements and other reasons. The next editions of the revised catalogs or manuals will be published with updated code numbers. Consult with your Yaskawa representative to confirm the actual specifications before purchasing a product.
